Preamble

The Heart and Stroke Foundation of Canada's (Heart & Stroke's) mission is to lead in eliminating heart disease and stroke and reducing their impact through the advancement of research and its application, the promotion of healthy living, and advocacy. To that end, Heart & Stroke is committed to enhancing the application of research results. By adopting this policy, Heart & Stroke expects that the cutting edge research we fund will be freely accessible and useable for the international research community, policymakers, health care administrators, clinicians, and the public.

Facilitating knowledge transfer and exchange (KTE) is fundamental to achieving our mission. With the advent of the Internet, the way that science and research are communicated has been transformed. Globally, there is a move to Open Access publication, enabling researchers to disseminate knowledge widely. Open Access can be delivered in two ways, which are commonly known as the Gold route and the Green route, described below.

While Open Access publishing is now firmly part of the publishing landscape, it is widely accepted that subscription and open-access models will co-exist for a while yet. Heart & Stroke respects researchers' decisions to publish their research findings in the journals with the highest editorial standards, and which will bring their work to the attention of those most likely to be interested in and use the new knowledge. Moreover, given the current incentive structure, academics understandably prefer to publish in the highest impact journals.

The Gold Route to Open Access

Following the Gold route, the author or author institution pays a fee to the publisher at publication time, the publisher thereafter making the material available free at the point of access.²

Fully Open Access journals are scholarly journals that are available online to the reader without financial, legal, or technical barriers other than those inseparable from gaining access to the internet itself (<u>Budapest Open Access Initiative</u>). Some are subsidized, and some require payment on behalf of the author.

At the same time, a great many high impact science journals are still based on subscription. In conventional publishing, the institution subscribes to the publication channel to obtain electronic access or paper copies.

However, many subscription-based journals have paid Open Access publishing options. These are known as *hybrid* journals.

Whatever the publishing model, publishers or journals fulfill a number of important functions, most importantly peer-review; and also editing, layout, conversion of text into XML coding, and more. These costs will not disappear. The costs associated with producing and distributing Open Access journals are nearly identical to those of non-Open Access journals. Current conservative estimates put these costs at around USD \$1500.3

The Green Route to Open Access

In addition, there are inexpensive self-archiving options for making published results openly available-while respecting traditional publishers' restrictions-at the time of submission or after a lag time, usually six to twelve months. Often called the green route to Open Access, this is not equivalent to publishing; instead it allows for the free availability of articles in parallel to any publication system.⁴

Policy Objective

The objective of this policy is to enhance access of our Heart & Stroke-funded research to a broad audience.

Definitions

Heart & Stroke adopts the Canadian Institutes of Health Research (CIHR) definition of **research outputs** as conceptual or practical knowledge, data, information, and physical or biological materials developed during the course of a research project that are integral for

³ <u>www.research-matters.net</u>: The RM Knowledge Translation Toolkit: A Resource for Researchers [International Development Research Centre (IDRC)and the Swiss Agency for Development and Cooperation (SDC)]

⁴ Jeffery K. 2006.

² Jeffery K. 2006. Open Access: An Introduction. ERCIM News 64. Available at: http://www.ercim.org/publication/Ercim News/enw64/jeffery.html

building on research discoveries. CIHR recognizes three categories of research outputs: peer-reviewed journal publications, research materials, and research data.

In this policy, **Open Access** means the free online access to scholarly publications, primarily the peer-reviewed journal publication. With Open Access, readers with network access are able to download, copy, share, and distribute publications for non-profit purposes without the barriers, particularly cost, associated with traditional subscription-based models for accessing publications.

Peer-reviewed journal publication means a manuscript for publication in a scholarly journal assessed by peers and deemed to be scientifically and ethically sound.

Guiding Beliefs

In developing this policy, Heart & Stroke is guided by our Mission and organizational values, from which arise the beliefs that the Heart and Stroke Foundation should:

- Demonstrate leadership in promoting broad dissemination of research outputs in a timely fashion:
- Recognize that the Internet has enabled Open Access in ways that have changed forever how information is shared: Open Access is the future.
- Acknowledge that publication costs are an integral part of the research process. The
 research is not finished until results have been appropriately disseminated.
- Align Heart & Stroke policies with other Canadian and international research funding agencies; and champion Open Access through advocacy.

Application / Compliance

This policy applies to all publications which report work and findings obtained with the support, in whole or in part, of any type of grant awarded June 1 2010 and onward from the Heart and Stroke Foundation (Heart & Stroke). Heart & Stroke also encourages immediate compliance with this policy by researchers publishing work supported by Heart & Stroke grants received before June 1 2010.

Heart & Stroke recognizes that there may be reasonable limitations and exceptions to compliance. However, researchers are expected to make every effort to comply and must notify Heart & Stroke staff immediately when there are exceptions or limitations.

Policy Statement

Heart & Stroke requires that all researchers supported in whole or in part through Heart & Stroke make their research outputs publicly available as soon as possible, but no later than twelve months after the final publication or availability of final results.

In this policy, Heart & Stroke defines research outputs as peer-reviewed journal publications, research data, and the results of clinical trials that will not be published in peer-reviewed journals.

Peer-Reviewed Journal Publication

Heart & Stroke grant recipients are required to ensure that the full text of all final peer-reviewed manuscripts accepted for publication are freely accessible through the Publisher's website or an online repository within six months of publication date.

There are two ways to adhere with this policy:

- 1. Submit your manuscript to a journal that offers immediate Open Access, or automatically deposits published papers in PMC with an embargo period of six months or less or offers Open Access to the paper on its website within six months of publication.
- 2. Author self-archiving: Deposit the peer-reviewed manuscript or published paper in (in order of preference):
 - PubMed Central (PMC) Canada or any PMC International site
 - A subject-specific repository
 - Your institutional repository
 - Your personal or research group website

Grant recipients must acknowledge Heart & Stroke contributions in all peer-reviewed publications.

Research Data

Additionally, grant recipients are required to deposit bioinformatic, atomic, and molecular coordinate data, as already required by most journals, into the appropriate public database immediately upon publication of research results.

Clinical Trial Results that will not be Published in a Peer-Reviewed Journal

As a member of the Health Charities Coalition of Canada (HCCC), Heart & Stroke subscribes to the HCCC Position Statement on Registration of Clinical Trials (May 2006). Integral to this position is the belief that selective reporting violates essential values and principles.

In order to adhere with this policy:

- Preferably, post the final results on the International Standard Randomized Controlled Trial Number (ISRCTN) Register (<u>www.controlled-trials.com</u>), or <u>ClinicalTrials.gov</u> or a pharma or industry website within six months of completion of the trial.
- Alternatively, deposit (archive) the final trial results report in your institutional repository or personal website within six months of completion of the trial.

Researchers are required to notify the Heart and Stroke Foundation when results have been posted.

Publication Costs

Heart & Stroke covers expenses that researchers reasonably may incur related to publishing in Open Access or hybrid scholarly journals.

For the most part, requests for all types of publication costs should be fully justified in the budget of the original grant application. However, policies for how publication costs are managed may differ across provincial Foundations. For Grant-in-Aid or other provincial Programs, researchers must contact the Foundation involved.

Monitoring and Adherence

By accepting Heart & Stroke funds, grant recipients accept the terms and conditions of the grant or award as set out in this and other published policies and guidelines. In the event of an alleged breach of Heart & Stroke funding policy, Heart & Stroke may take steps to deal with the allegation.

Advocacy

Heart & Stroke will advocate, through the Health Charities Coalition of Canada, to advance Open Access publishing. This includes putting pressure on non-compliant journals to allow for public availability within six months and pursuing strategies to decrease Open Access publishing costs.

Appendix 1: Resources

• The Canadian Institutes of Health Research (CIHR) Policy on Access to Research Outputs contains an annex, copied below on November 4 2009, providing examples of research outputs and corresponding publicly accessible archive, repository or database. Note that the table will be updated by CIHR as required.

Examples of research outputs and corresponding publicly accessible archive, repository or database		
Peer-reviewed journal publications: Publicly accessible archive or repository		
PubMed Central		
Institutional Repositories at Canadian Universities		
Directory of Open Access Repositories (International)		
Research data	Public database or archive	
Nucleic acid sequences	<u>GenBank</u>	
Gene expression data	Gene Expression Omnibus	
Structure data	Research Collaboratory for Structural Bioinformatics (RCSB) Protein Data Bank	
Single nucleotide polymorphisms (SNPs)	The Single Nucleotide Polymorphisms Database	
Molecular interaction data	See International Molecular Exchange Consortium (IMEx) Partners	
Proteomics data*	PRoteomics IDEntifications database (PRIDE) [European Bioinformatics Institute (EBI)] PeptideAtlas [Institute for Systems Biology (ISB)] Global Proteomics Machine (GPM)	

^{*} Given that proteomics is a burgeoning field, standards for data storage and deposition are still in development. Therefore, CIHR-funded investigators that are generating proteomics data are encouraged to deposit their trace files in one of the three Open repositories. CIHR will follow the trends in this field and update this table as necessary.

- Free Medical Journals
- The <u>SHERPA/RoMEO</u> database contains a searchable listing of journal publisher's copyright and self-archiving policies.
